Northstar Cloud

SaaS Subscription Analytics — Instructor Solution Report

1. Executive Baseline

Metric	Reference Result
Latest active ARR	£1,092.6m
Active logos	4,328
Latest NRR	97.8%
Latest GRR	95.6%
Critical / At-Risk active ARR	£47.1m
Annualized excess-discount leakage	£20.90m
Healthy + ≥80% utilization ARR pool	£166.9m
Diagnostic churn-model AUC	0.634

2. Data Quality Solution

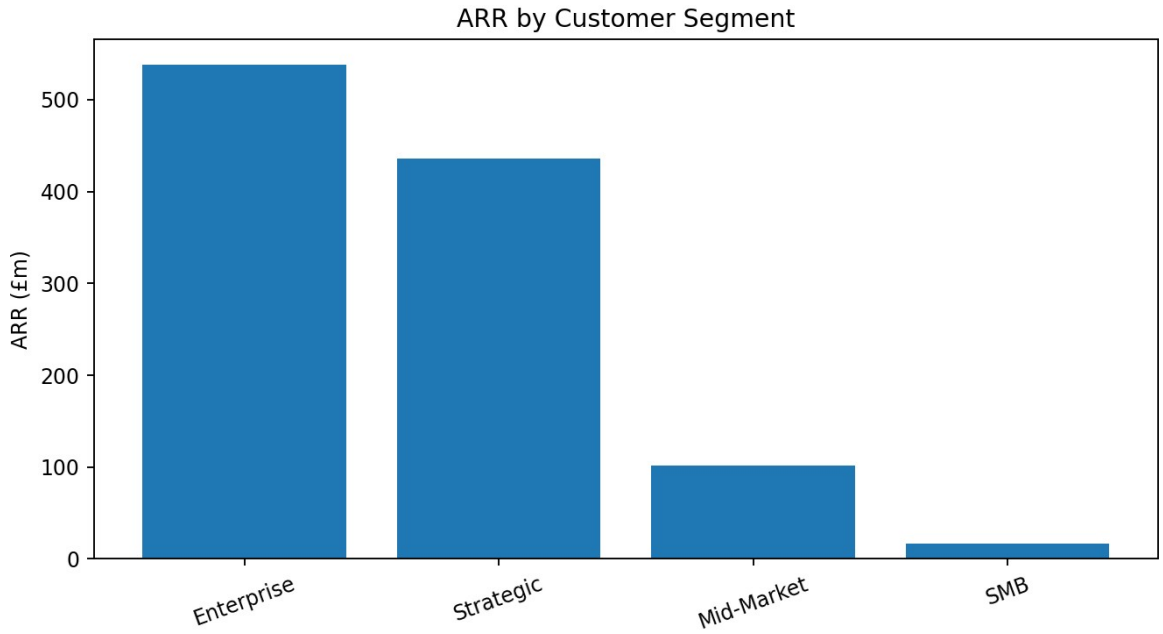

The learner raw layer deliberately includes controlled defects. Fix them before constructing recurring-revenue metrics.

Table	Column	Issue	Fix
dim_accounts	industry	Case inconsistency	Normalize with INITCAP/TRIM
dim_accounts	region	Category inconsistency	Map to canonical value
dim_accounts	acquisition_channel	Whitespace	TRIM
dim_accounts	employee_count	Missing values	Impute/flag based on use case
fact_monthly_account_snapshot	seat_utilization	Missing values	Recalculate active_users / seats
fact_monthly_account_snapshot	discount_pct	Scale error	If >1 divide by 100
fact_monthly_account_sn	nps_score	Invalid range	Set outside 0–10 to NULL

apshot			
fact_invoices	invoice_id	Duplicate rows	Deduplicate on invoice_id
fact_invoices	payment_status	Case inconsistency	INITCAP/TRIM
fact_support_tickets	ticket_type	Case inconsistency	Canonical mapping

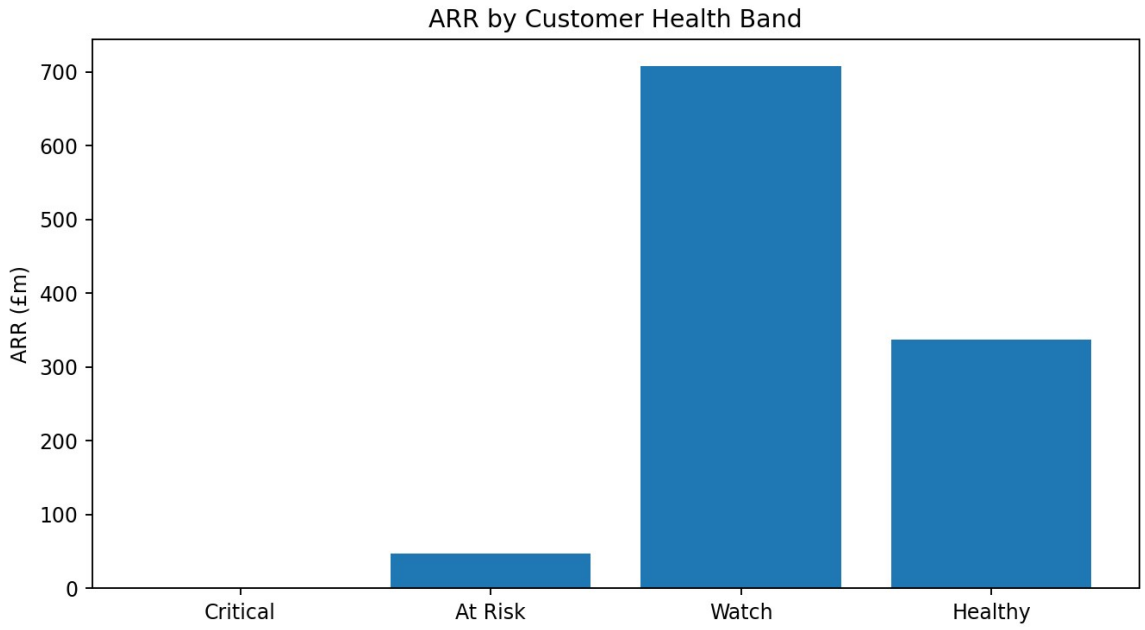

3. Revenue Retention

Latest NRR is 97.8% while GRR is 95.6%. Expansion offsets part of gross leakage, but the installed base is not fully self-compounding. Retention, contraction and expansion therefore need separate management actions.

4. Customer Health

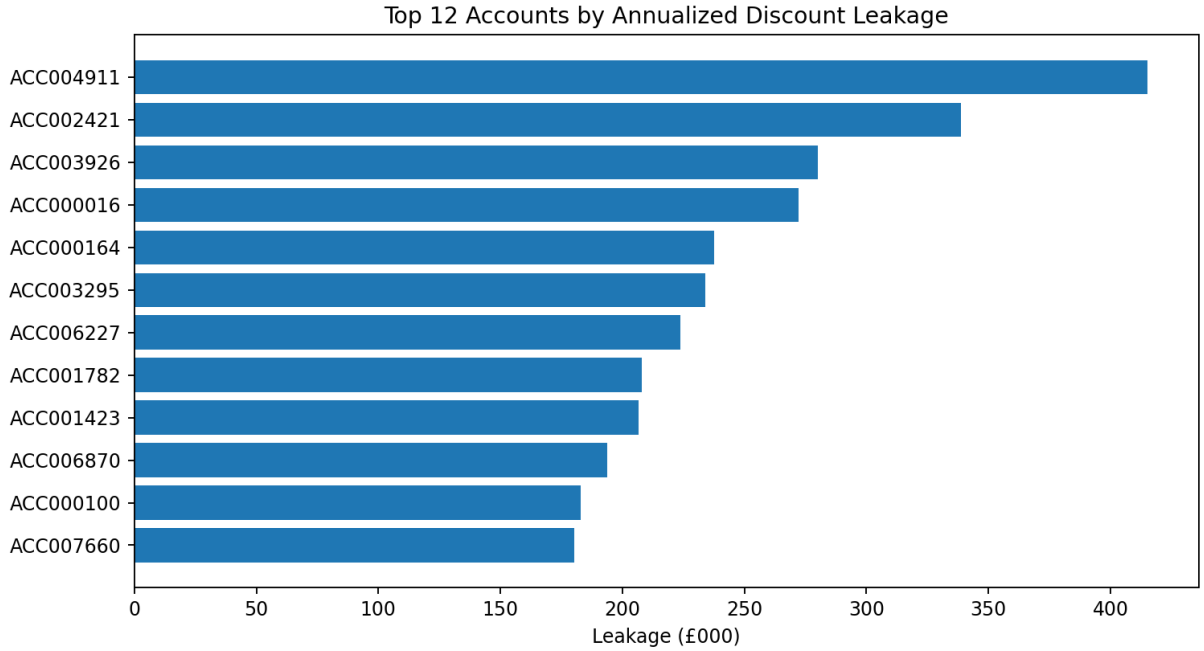

Reference health weights: 35% usage, 20% NPS, 18% support, 12% payment behaviour and 15% revenue trend. The score is a prioritization heuristic, not a causal claim.

Health Band	Accounts	ARR (£m)
At Risk	257	47.1
Healthy	1202	337.2
Watch	2869	708.2

5. Pricing & Monetization

Excess discounting represents approximately £20.90m annualized leakage. Treat this as an addressable pool and apply a realistic capture rate.

6. Expansion & Renewal Prioritization

- Healthy, ≥80% utilized accounts represent £166.9m of active ARR suitable for targeted expansion analysis.
- The 90-day renewal queue contains 1,558 current active accounts.
- Use account drill-through to validate usage, NPS, critical support events and payments before action.

7. CSM Operating Model

CSM	Accounts	Portfolio ARR £m	Risk ARR £m	Capacity
AM027	116	32.2	5.8	194.4%
AM006	118	29.1	4.0	97.9%
AM023	103	27.8	2.8	106.2%
AM039	135	33.4	2.5	185.4%
AM009	128	41.0	2.3	163.4%
AM030	112	23.6	2.3	123.8%
AM021	104	26.8	2.1	184.8%
AM025	122	37.0	2.0	112.4%
AM034	115	19.1	1.8	56.1%
AM003	93	22.1	1.7	66.3%

8. Reference 90-Day Recommendations

Priority	Recommendation	Why	KPI
1	Retention command center	Protect high-value ARR before renewal	ARR at risk; GRR
2	Adoption rescue	Low utilization is actionable before churn	Seat utilization
3	Discount governance	Recover value without acquiring logos	Pricing leakage
4	Targeted expansion	Healthy/high-use accounts are credible upsell targets	Expansion MRR; NRR
5	CSM rebalance	Coverage should follow value and risk	Risk ARR per CSM

9. Consulting Interpretation

The solution should end with a small number of quantified actions, not a list of charts. Opportunity pools must be converted to low/base/high impact using explicit capture assumptions.
